PROFILE

Full-stack developer with three years of commercial .NET experience and a current role automating business operations for a Sydney company. I build AI workflows that run in production every day: marketing automation in n8n, a customer chatbot that calls live order data, agents that triage email and draft offers, and a self-hosted LLM that removed the company's per-token API costs. Now completing a Master of Artificial Intelligence (Cybersecurity) at Western Sydney University and seeking an ICT Practicum placement (INFO7004, Spring 2026) to apply the same approach to estimating, quotation and project workflows.

EXPERIENCE

Automation & DevOps Engineer · Beyond Tomorrow Enterprises, Sydney (casual) Feb 2025 to present

- Sole administrator of the company's Ubuntu server: nine production websites (a multi-store e-commerce group, a jewellery retailer, a restaurant and an online marketplace) plus self-hosted n8n and Matomo analytics.
- Stood up a self-hosted LLM: Ollama running Gemma 12B on an RTX 5060 workstation, published securely through a Cloudflare Tunnel with Zero Trust access. The business now has unlimited inference with no per-token cost.
- Built a customer chatbot (Node.js) that answers product questions and fetches live order status through function calling; it runs in production on the retail sites, backed by the self-hosted model.
- Designed n8n marketing workflows: abandoned-cart recovery (about 250 emails a month) and AI-written product suggestions and upsells based on each customer's purchase history.
- Automated social publishing from a Google Sheet: staff enter a Drive link, title and post time; the workflow posts to Facebook, Instagram, TikTok and YouTube through developer apps I registered myself, then confirms on Telegram.
- Deployed OpenClaw agents that watch the business inboxes, push alerts to Telegram and Slack, and chase unanswered mail with reminders ranked by priority. A second agent drafts discount offers for slow-moving stock within a fixed limit.
- Added one-click AI description and SEO generation to the store admin, and built a customer quoting service for the jewellery client (kazurina.com.au) and a SaaS product, invyt.com.au.
- Built a livestream workflow for the marketplace client: one login streams to four platforms at once (OBS, Social Stream Ninja, WebSockets, Python with Playwright), with comments from every platform collected on a single page for on-screen display.
- Wrote a custom WordPress e-commerce management plugin and theme covering invoices, packing slips and payments.

Full Stack .NET Developer · Pipilika Soft, Dhaka 2021 to Nov 2024

- Developed modules of an education-sector ERP used by universities, colleges and schools: HR and payroll, leave and attendance, library, inventory, and academic and exam management (C#, ASP.NET MVC5, Entity Framework, MS SQL Server).
- Core developer on a national online admission system covering eligibility checks, fee payment, admit cards, seat plans and results for about 350,000 applicants a year, with roughly BDT 20 million processed annually.
- Integrated payment gateways, bulk SMS, Education Board APIs and ZKTeco attendance hardware reporting directly to the server with no PC relay.
- Maintained CI/CD pipelines and managed Ubuntu, WHM and cPanel servers for client platforms and e-commerce sites.

EDUCATION

Master of Artificial Intelligence, Cybersecurity major · Western Sydney University

2025 to present

- Capstone (in progress): AI screening system for diabetic retinopathy. Five-class severity grading of retinal images in PyTorch, benchmarking VGG16, ResNet50, DenseNet121, EfficientNetB0 and a CNN-Transformer, with Grad-CAM explainability and referral logic. Team of four with weekly supervisor and client meetings, documented with minutes and agendas.
- Research project: automated negotiation between autonomous vehicles, supervised by Prof. Dongmo Zhang. Simulation work in SUMO and OpenDRIVE on the narrow bridge problem.
- Coursework: a regression model that detects brute-force login attacks and recommends a block or a challenge for each source.

BSc in Computer Science & Engineering · American International University-Bangladesh

2017 to 2021

CGPA 3.99 / 4.00. Summa Cum Laude, Gold Medal.

SELECTED PROJECT

mdnurislam.com · My portfolio is itself an AI product: visitors interview an AI avatar that answers with my real data through OpenAI function calling (Vercel AI SDK, Next.js 16). It includes a browser-based admin panel for editing content, and a Hex board game with five AI difficulty levels, from simple heuristics to minimax and Monte Carlo tree search, plus peer-to-peer multiplayer over WebRTC. Self-hosted on an Ubuntu VPS I manage with systemd and a deploy pipeline.

SKILLS

AI & automation	OpenAI API, Vercel AI SDK, function calling, Ollama and open-weight models, n8n, OpenClaw, prompt design; ChatGPT and Claude in daily work
Languages	TypeScript, JavaScript, C#, Python, PHP, SQL
Frameworks	Node.js, Express, React, Next.js, ASP.NET MVC, Entity Framework, WordPress plugin and theme development
Databases	MySQL, MS SQL Server, Prisma ORM, SQLite
Infrastructure	Ubuntu, systemd, Cloudflare (DNS, Tunnel, Zero Trust), cPanel and WHM, CI/CD, Matomo, Google Analytics

PLACEMENT DETAILS

Unit	INFO7004 ICT Practicum, Spring 2026 (120 hours)
Availability	Monday, Wednesday and Saturday, on site at North Rocks
Work rights	Student visa; a placement taken as part of the course sits outside the fortnightly work limit

REFEREES

Tony Kazzi	CEO, Austimpext Ltd (parent company of Beyond Tomorrow Enterprises) · contact details on request
Prof. Dongmo Zhang	Western Sydney University · contact details on request
